Redox Signal Mediators In and Between Cells

Edited by **Iria Medraño-Fernandez , Gerd Patrick Bienert** Technical University of Munich, **Roberto Sitia**

Series: *Oxidative Stress and Disease*

To produce energy, aerobic organisms transform oxygen molecules into water. This reductive mechanism yields toxic radical intermediates, collectively known as reactive oxygen species (ROS). Paradoxically, these physiological processes entail the production of potentially damaging species. Evolution has turned this apparent disadvantage into an opportunity for transmitting information. Peroxioporins, H2O2 transporting proteins spanning biological membranes, distribute the signal from emitters to receptors. Thus, these channels are strategically situated in the thin line between life and death, guaranteeing adequate but safe signaling.

Surgical and Medical Treatment of Osteoporosis

Principles and Practice

Edited by **Peter V. Giannoudis , Thomas A. Einhorn**

Osteoporosis is the most common bone disease and is associated with pathological fractures that can lead to significant morbidity. It represents an economic burden to the health care system, directly linked to an ageing population. Guidelines on osteoporosis prevention have been published but these do not provide the required specialised knowledge for the treating physician. This book 'fills the gap' and focuses on the principles of surgical and medical treatment of osteoporosis. It aims to improve education and provide answers based on current evidence, helping doctors follow best practice, improve patient care and outcomes, and minimise the complications of medical and surgical management.
